# Example of Strategy for an optimized digital mapping of an excavation

## Context of application: The archaeological site of Puig Ciutat

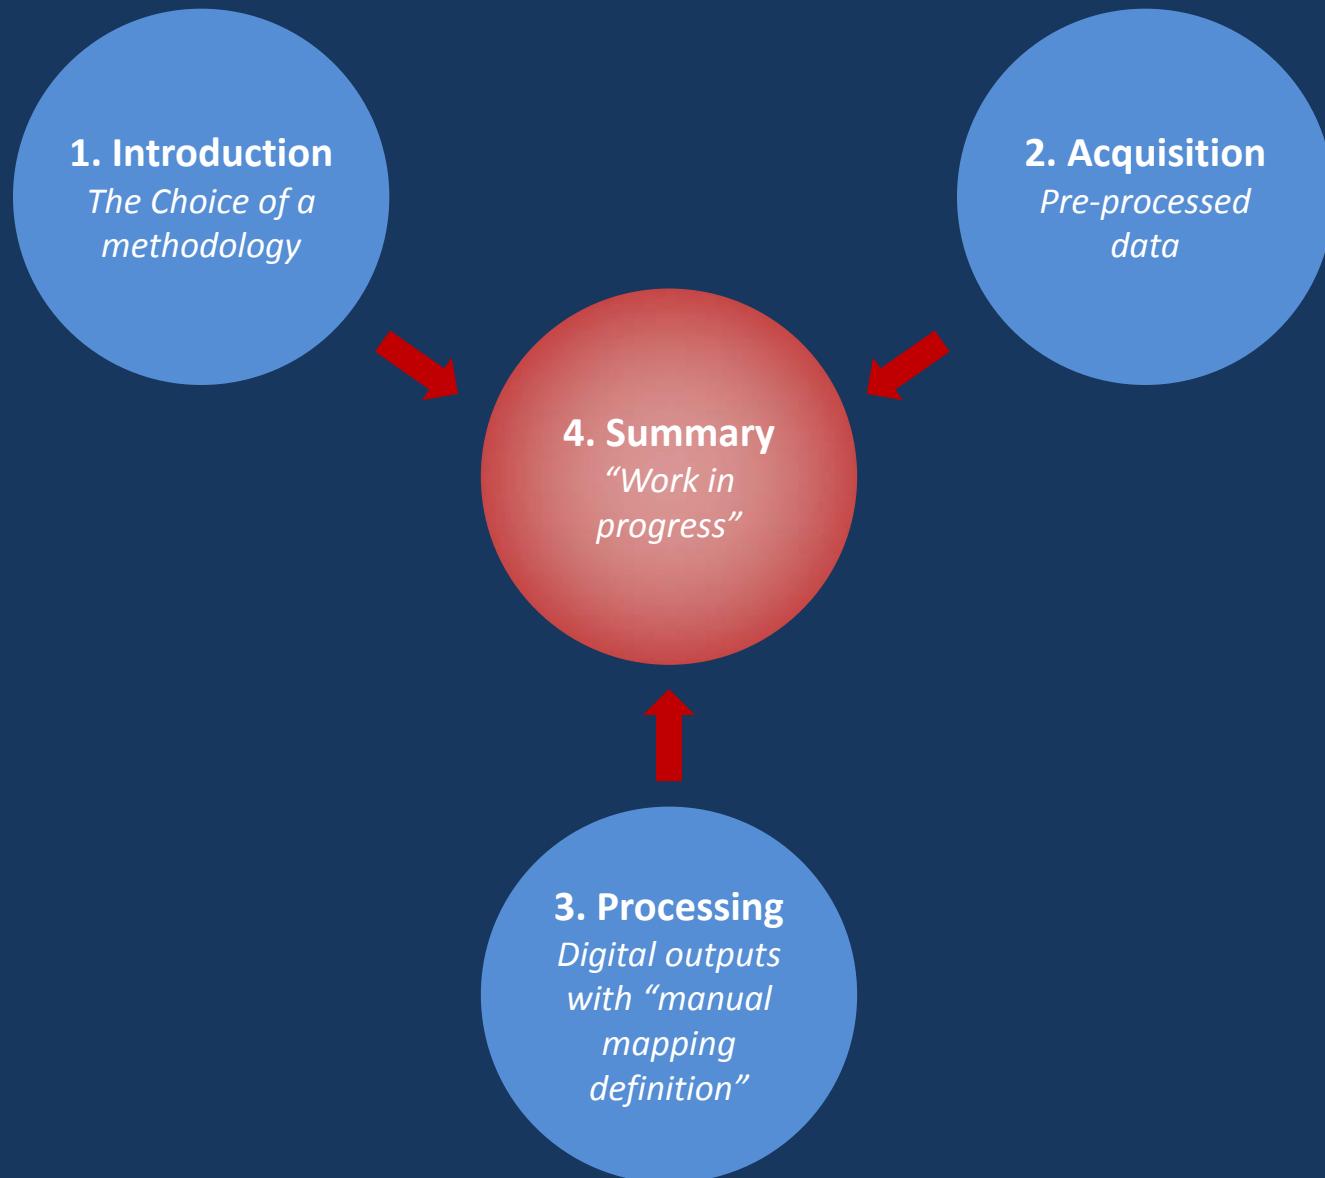

Puig Ciutat is a Roman settlement used as a test site for the implementation of new methodologies

The project needed a methodological approach and a platform for a combined interpretation of both exploration and excavation results

The main limiting factors being a limited budget, only two weeks of excavation per year, a processing depending on volunteer work and no staff fully dedicated to the projected

# Example of Strategy for an optimized digital mapping of an excavation

**PART 1**  
**Introduction**  
**The Choice of a Methodology**

**PART 2**  
**Acquisition**  
**Pre-processed data**

**PART 3**  
**Processing**  
**Digital outputs with a “manual definition”**

**PART 4**  
**Summary**  
**“Work in Progress”**

## 1.1 Mapping an excavation: From manual to digital

### First campaigns with manual mapping

Local references for each excavated sector

Difficult comparison with exploration results

### Third campaign with a total station

Easy use for the referencing of artefacts

Problems to define a nomenclature for the acquired points

Problems to decide when to use it without losing the definition of the manual approach

### Fourth campaign with a robotized total station

Only one operator for the mapping

Acquisition with a clear nomenclature limiting field documentation

Implementation of a protocol for the digital mapping of the excavation

## 1.2 Systems and Software: A large diversity

Manual measures + Dumpy level

Separated (X, Y) and Z  
Relative references  
Continuous representation

## 1.2 Systems and Software: A large diversity

Manual measures + Dumpy level

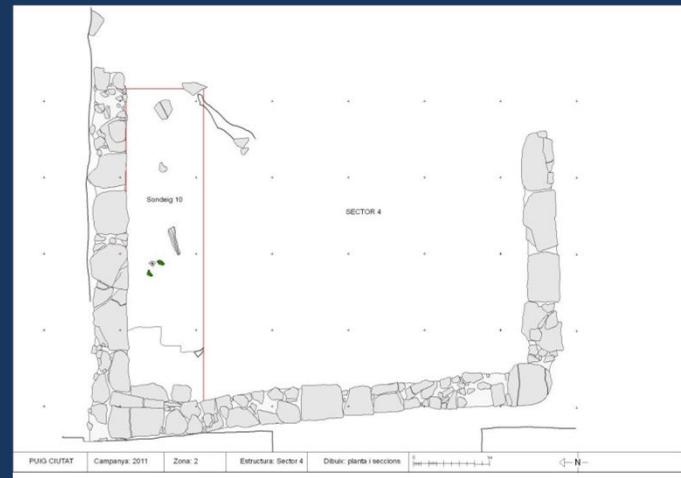

Field measures

Separated (X, Y) and Z  
Relative references  
Continuous representation  
Manual transfer to digital formats

Digital results

## 1.2 Systems and Software: A large diversity

Differential  
GPS

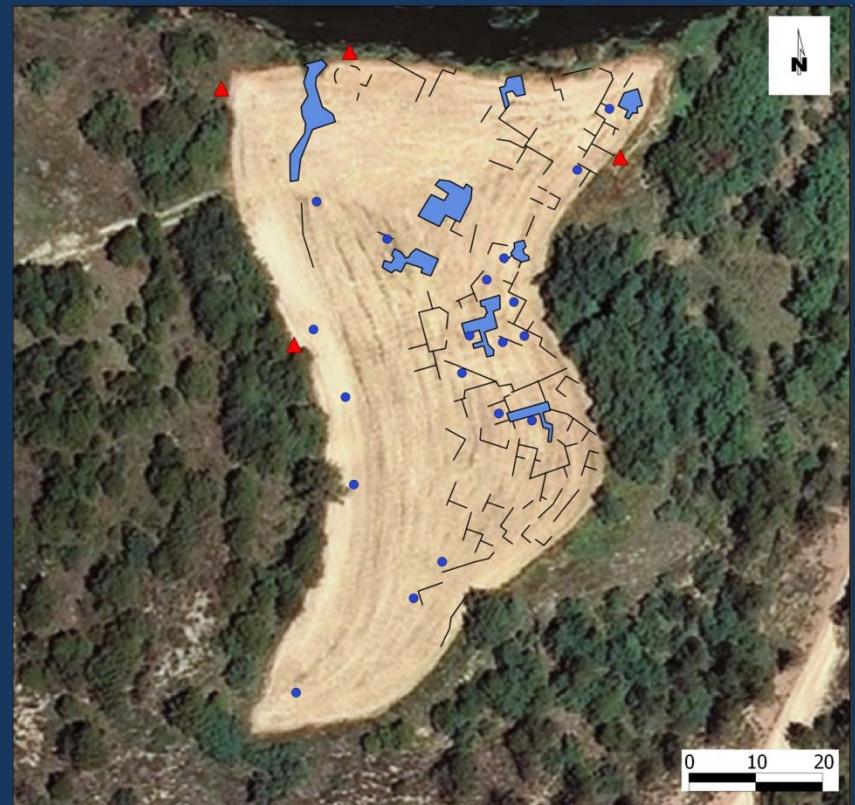

Varying precision  
Satellite coverage dependent

## 1.2 Systems and Software: A large diversity

Differential  
GPS

Varying precision  
Satellite coverage dependent  
Used for global referencing

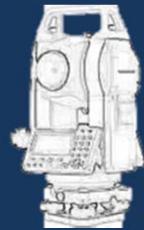

Points for georeferenciation and referenced  
geophysical interpretation

## 1.2 Systems and Software: A large diversity

Total Station

Robotized  
Total Station

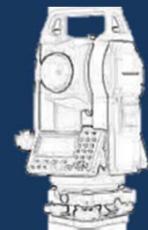

Georeferenced Coordinates  
Digital data  
Possibility of measures with only 1 operator

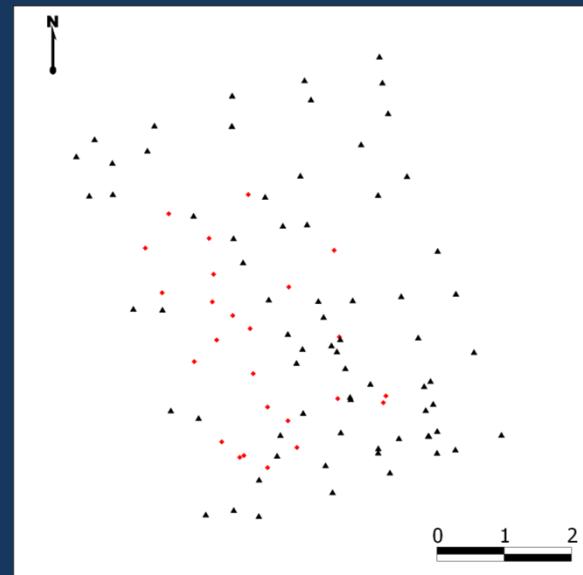

## 1.2 Systems and Software: A large diversity

Total Station

Robotized  
Total Station

Georeferenced Coordinates  
Digital data  
Possibility of measures with only 1 operator  
Scattered points

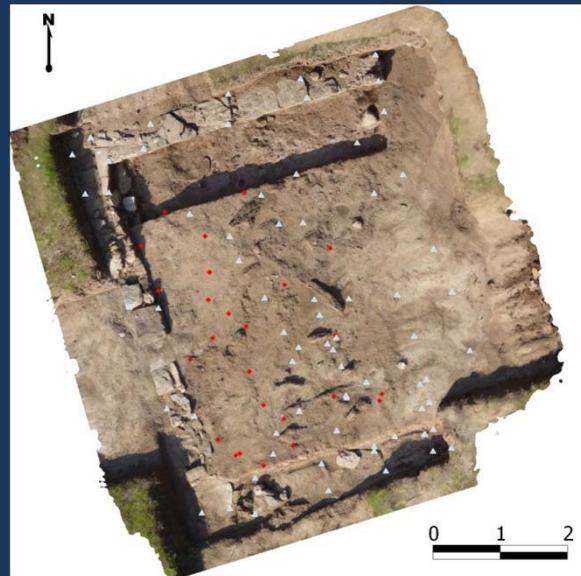

## 1.2 Systems and Software: A large diversity

Total Station

Robotized  
Total Station

Georeferenced Coordinates  
Digital data  
Possibility of measures with only 1 operator  
Scattered points

## 1.2 Systems and Software: A large diversity

Dumpy level

Differential  
GPS

Total Station

**The topographical systems do not offer viable geo-referenced continuous digital mapping possibilities**

## 1.2 Systems and Software: A large diversity

Dumpy level

Differential  
GPS

Total Station

+

Digital  
Camera

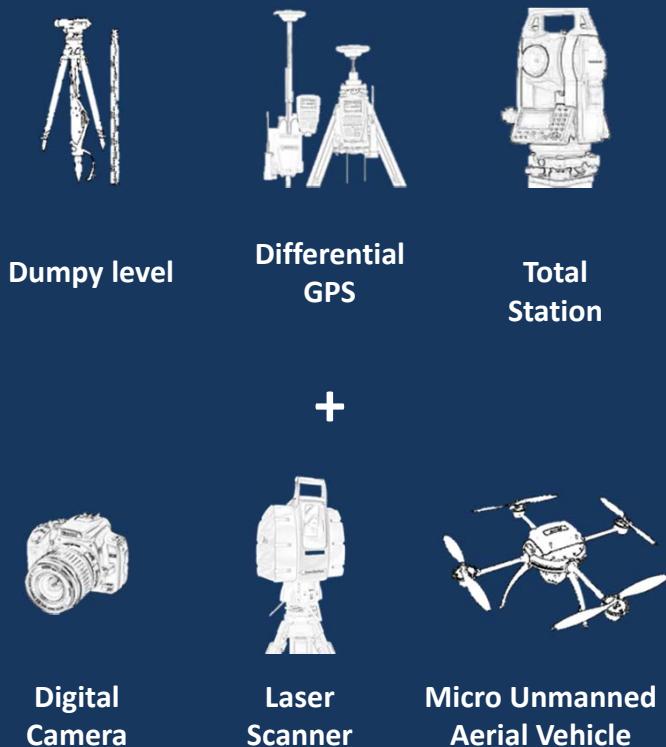

Laser  
Scanner

Micro Unmanned  
Aerial Vehicle

The coordinates acquisition can be combined with digital mapping systems

## 1.2 Systems and Software: A large diversity

A large diversity of software are in use

Vector Graphics Editors

Office and Database management

CAD and GIS

3D Software

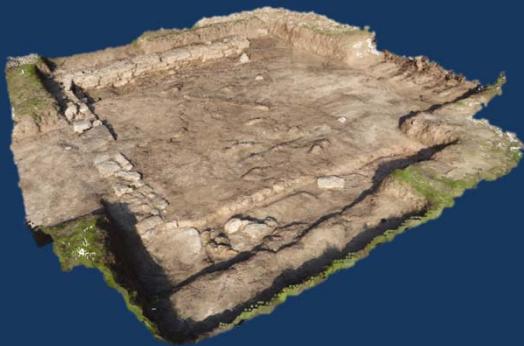

Dedicated software

In order to process , combine and present the acquired data

## 1.3 3D Models: 3D acquisition, when and how?

### First approach

Systematic use of photogrammetry for the documentation of each stratigraphic unit

### Problems

Interferences with the excavation process  
(light, cleaning, timing, deterioration of the exposed artefacts)

Specific time consuming and computer dependent processing

Large data volumes that require additional archiving specifications

## 1.3 3D Models: 3D acquisition, when and how?

### Second approach

Use of photogrammetry for the documentation complex 3D structures

Additional ortho-rectified photographs combined with a 3D surface for the documentation of the stratigraphic units

### Advantages

Interferences with the archaeological excavations are very limited in time

The processing is limited and can be performed with GIS tools

The large data volumes are restricted to complex structures while most of the documentation consists of single high resolution photographs

## 1.4 Summary of Choices

|                    |   |
|--------------------|---|
| <b>Systems</b>     | <b>Robotized Total Station and Digital Camera</b><br><i>Requires a documentation of the measured points</i>   |
| <b>Acquisition</b> | <b>A Pre-processed acquisition</b><br><i>Implementation of an acquisition protocol that defines the nomenclature of the measured points and the objects to map</i>  |
| <b>Software</b>    | <b>Open source solutions for processing, mapping and data management</b><br><b>Final rendering with Vector Graphics Editor</b><br><i>Requires the design of the database and the transfer of the existing information</i> |
| <b>3D Models</b>   | <b>A Combined approach</b><br><i>An intermediate methodology in order to enlarge documentation possibilities while limiting data, processing and breaks in the excavation process</i>                                     |

**PART 1**  
**Introduction**  
**The Choice of a Methodology**

**PART 2**  
**Acquisition**  
**Pre-processed data**

**PART 3**  
**Processing**  
**Digital outputs with “manual definition”**

**PART 4**  
**Summary**  
**“Work in Progress”**

## 2. Acquisition: Pre-processed data

**How can the topographical acquisition be designed for an easier export and processing of the results?**

1

Objects to map

2

Nomenclature

3

Special cases

4

Field work documentation

## 2.1 Categories of Objects to map

We defined the different categories that should be mapped and easy to separate during processing

Artefact

Soil samples

Stratigraphic Units

Ortho-rectified photographs associated to objects

Vertical sections

Reference Points

Photogrammetries

## 2.2 Nomenclature of the acquisition

### How to assign a unique identifier to points during the topographical acquisition

Field 1

Field 2

Category and Id Number

-

Point Number

Stratigraphic Unit

Unique Key Identifier

C Artefacts with coordinates

C-19 2099

PXX Planimetry

P05-34 2101

SXX Vertical section

Relative point  
number

Unique Id per:

Zone

Sector

Campaign

MXX Soil sample

(...)

RXX Reference point

FXX Photogrammetry

CatXXF

Ortho-rectified photograph

C19F-04 2099

## 2.3 Specific cases

A specific methodology was implemented for certain categories of objects in order to anticipate the processing

### Planimetrics

First, the lateral extension of the stratigraphic unit is measured

Points must  
be ordered in  
sequence

## 2.3 Specific cases

A specific methodology was implemented for certain categories of objects in order to anticipate the processing

### Planimetrics

First, the lateral extension of the stratigraphic unit is measured

The last measured point is identified and documented

## 2.3 Specific cases

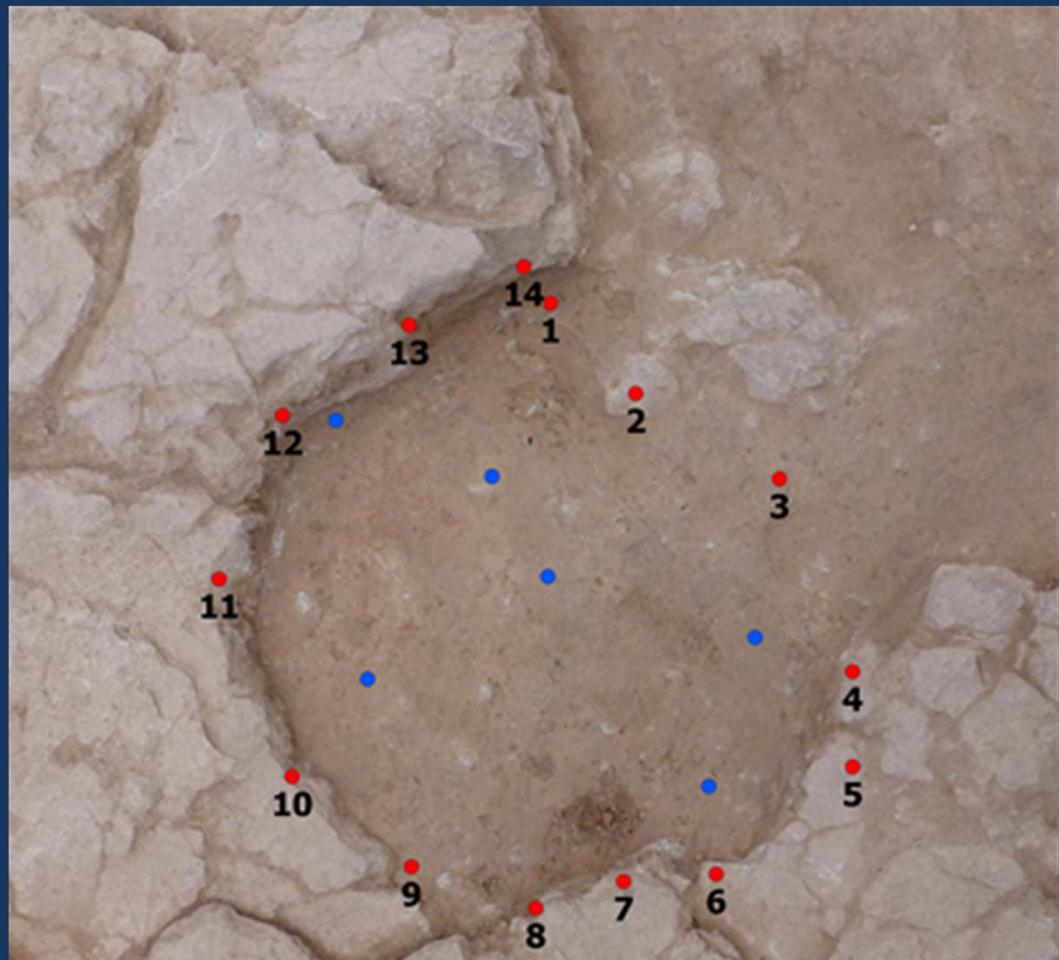

A specific methodology was implemented for certain categories of objects in order to anticipate the processing

### Planimetrics

First, the lateral extension of the stratigraphic unit is measured

The last measured point is identified and documented

Then inner points are measured to document the vertical variations

## 2.3 Specific cases

A specific methodology was implemented for certain categories of objects in order to anticipate the processing

### Ortho-rectified Photographs

Photographs of singular objects are taken with reference points

The lower-left reference has a colored marker

The sequence of measures goes clockwise starting from the colored marker

## 2.4 Field work documentation

Additional information is registered during field work as a help for the processing

| Planimetria | UE   | N total | Perimetre final | Observacions   |  |  |  |  |  |
|-------------|------|---------|-----------------|--|--|--|--|--|--|
| P001        | 2096 | 15      | 15              |  |  |  |  |  |  |

Geo-Tagging

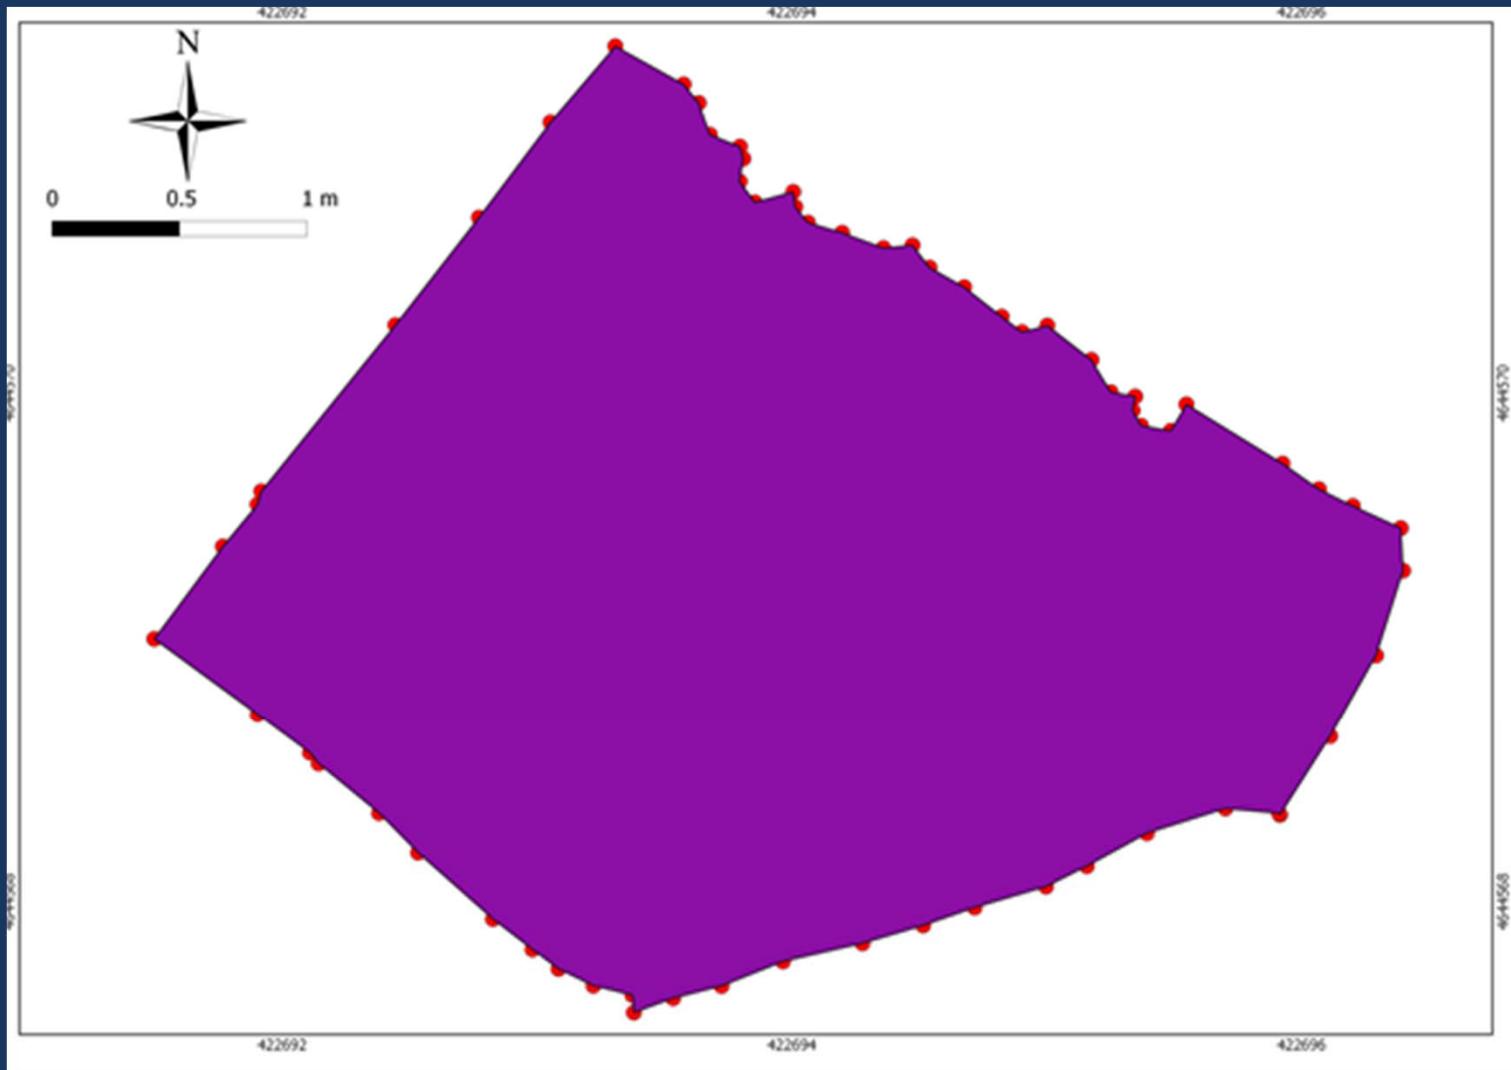

## 3.2 Stratigraphic Unit

First separate perimeter points from inner ones

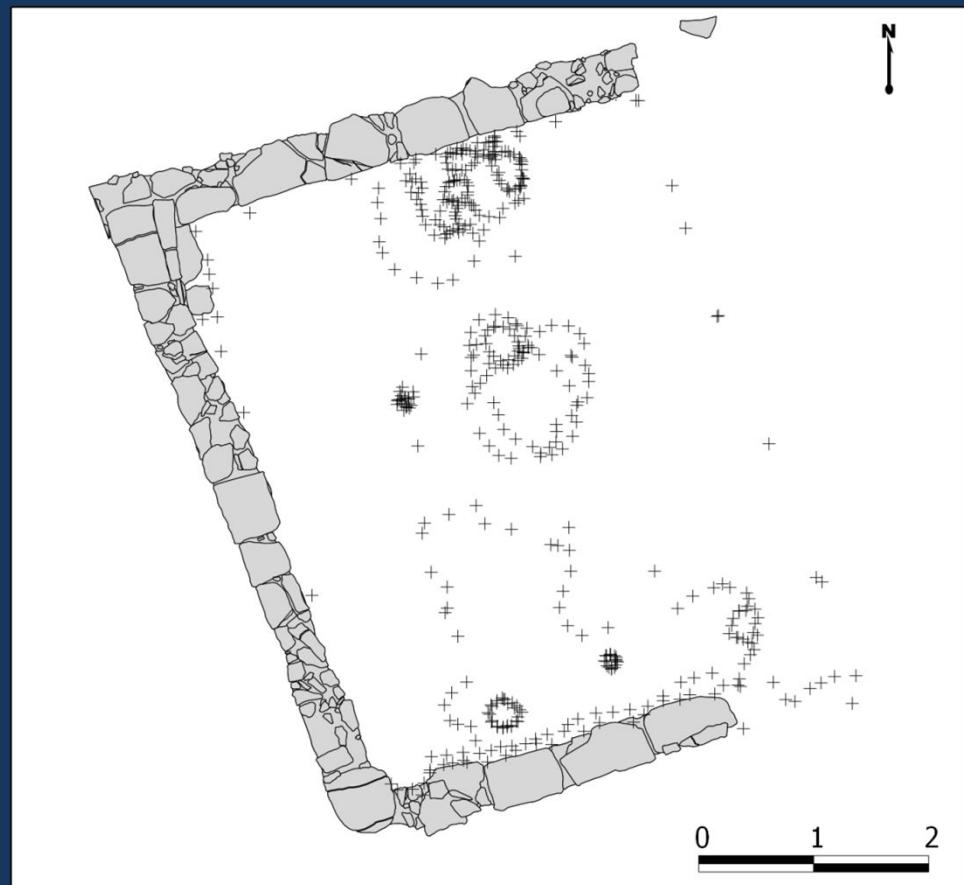

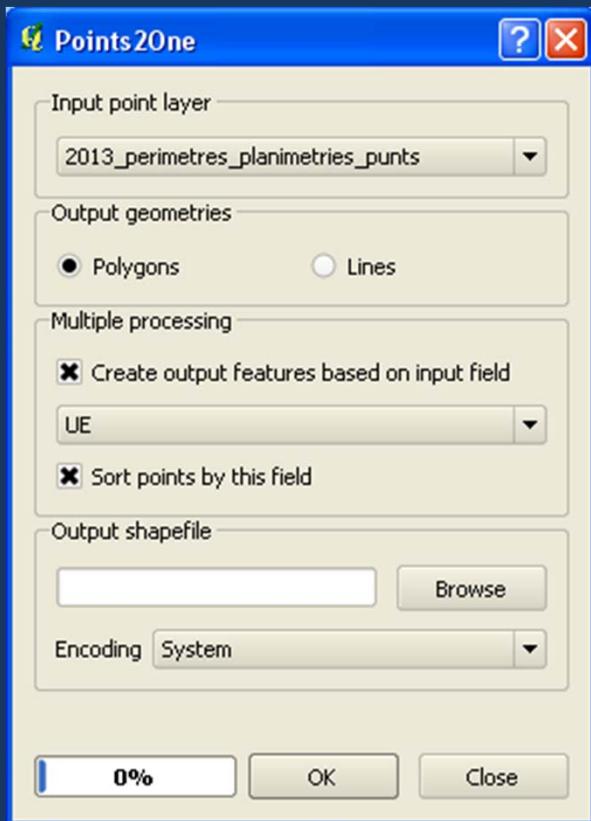

## 3.2 Stratigraphic Unit

**Then convert them to a polygon, which is done correctly if points were measured in sequence**

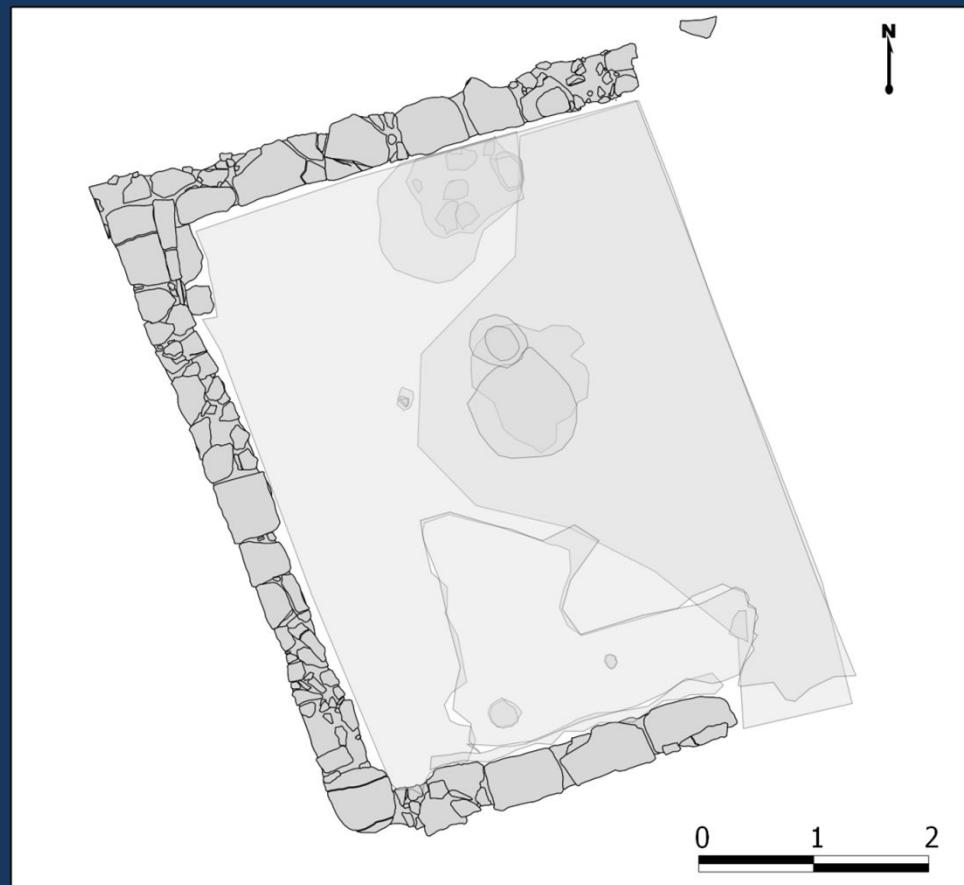

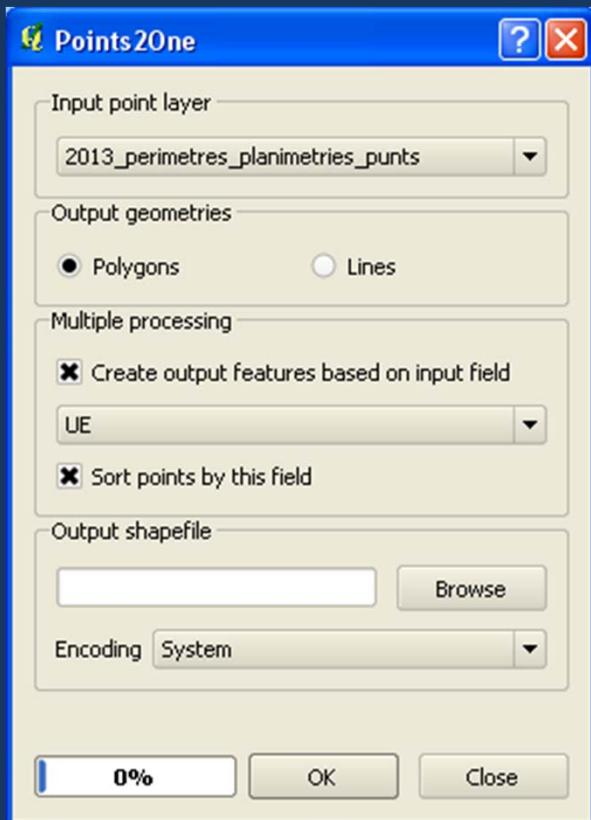

## 3.2 Stratigraphic Unit

As the Stratigraphic Unit information is associated to the points, the operation of converting all the planimetrics of the excavation can be done in one single operation

## 3.2 Stratigraphic Unit

As the Stratigraphic Unit information is associated to the points, the operation of converting all the planimetrics of the excavation can be done in one single operation

## 3.2 Stratigraphic Unit

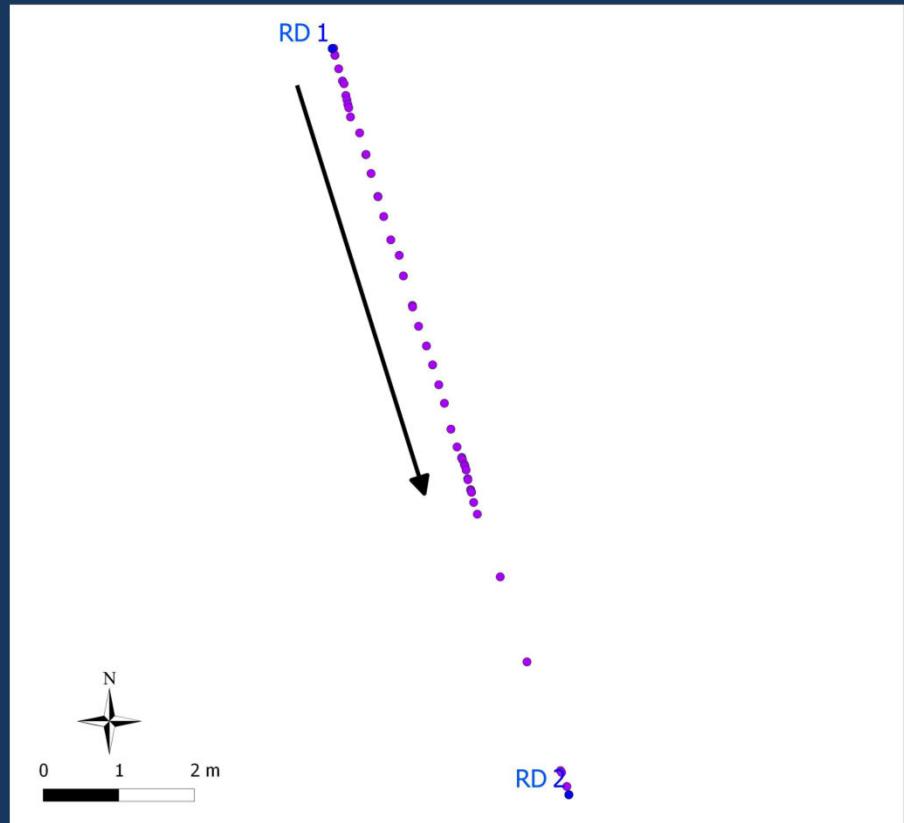

Last we add the 3D gridded information of the planimetrics to the 3D model

### 3.3 Vertical Sections

For each section several levels were acquired during the excavation. Points are compiled by section, starting from the associated reference point.

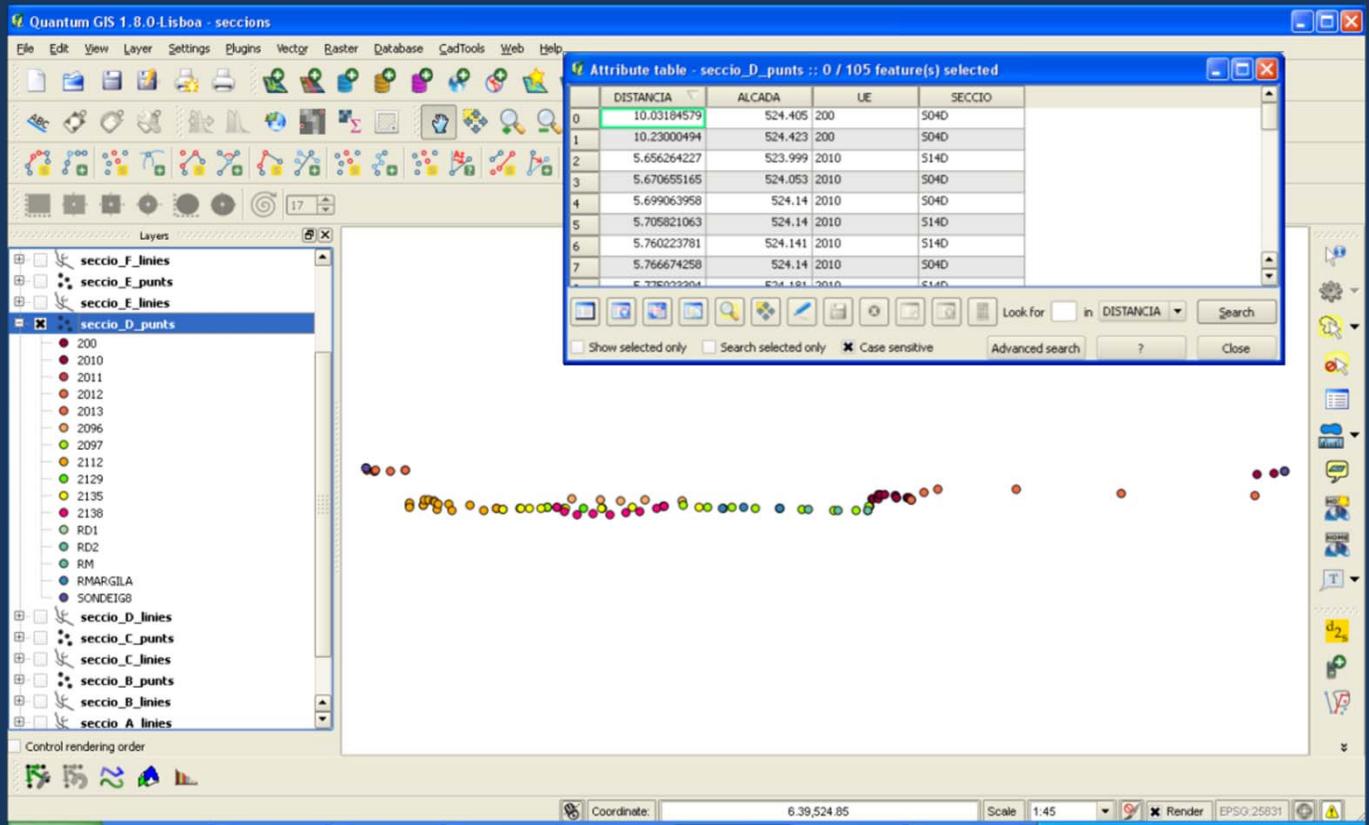

| X          | Y          | Z       | NOM  | Num | CODI |

### 3.3 Vertical Sections

Points are converted to lines using the stratigraphic unit as sorting property

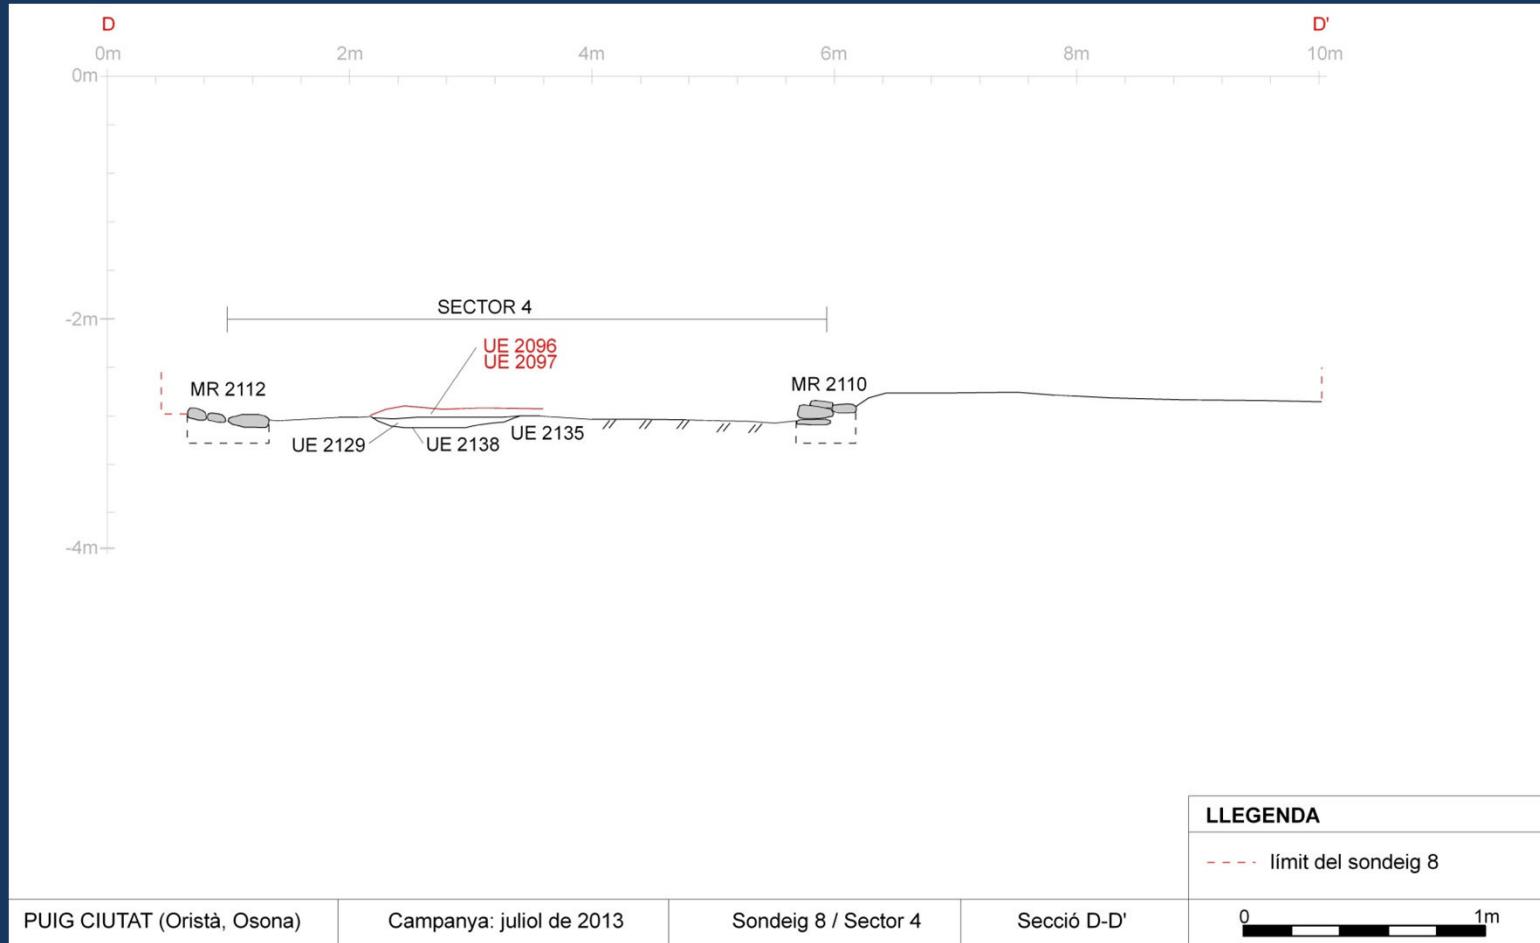

### 3.3 Vertical Sections

The processed output is exported in a vectorial format for additional editing

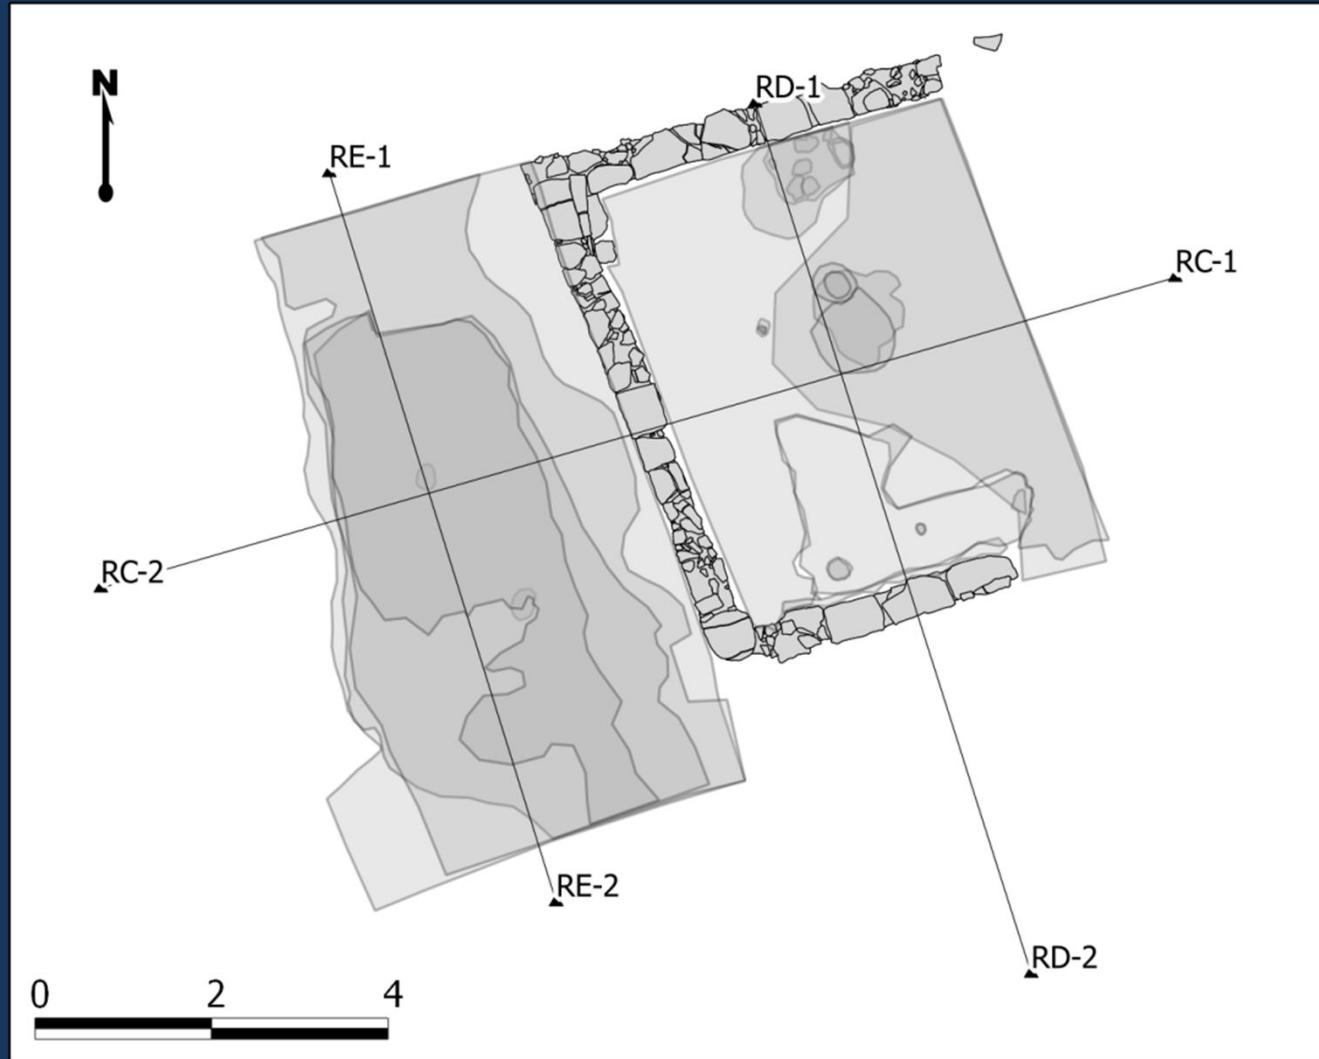

### 3.3 Vertical Sections

The vertical variations of the section that could not be measured with the total station are added to the section as well as complementary information

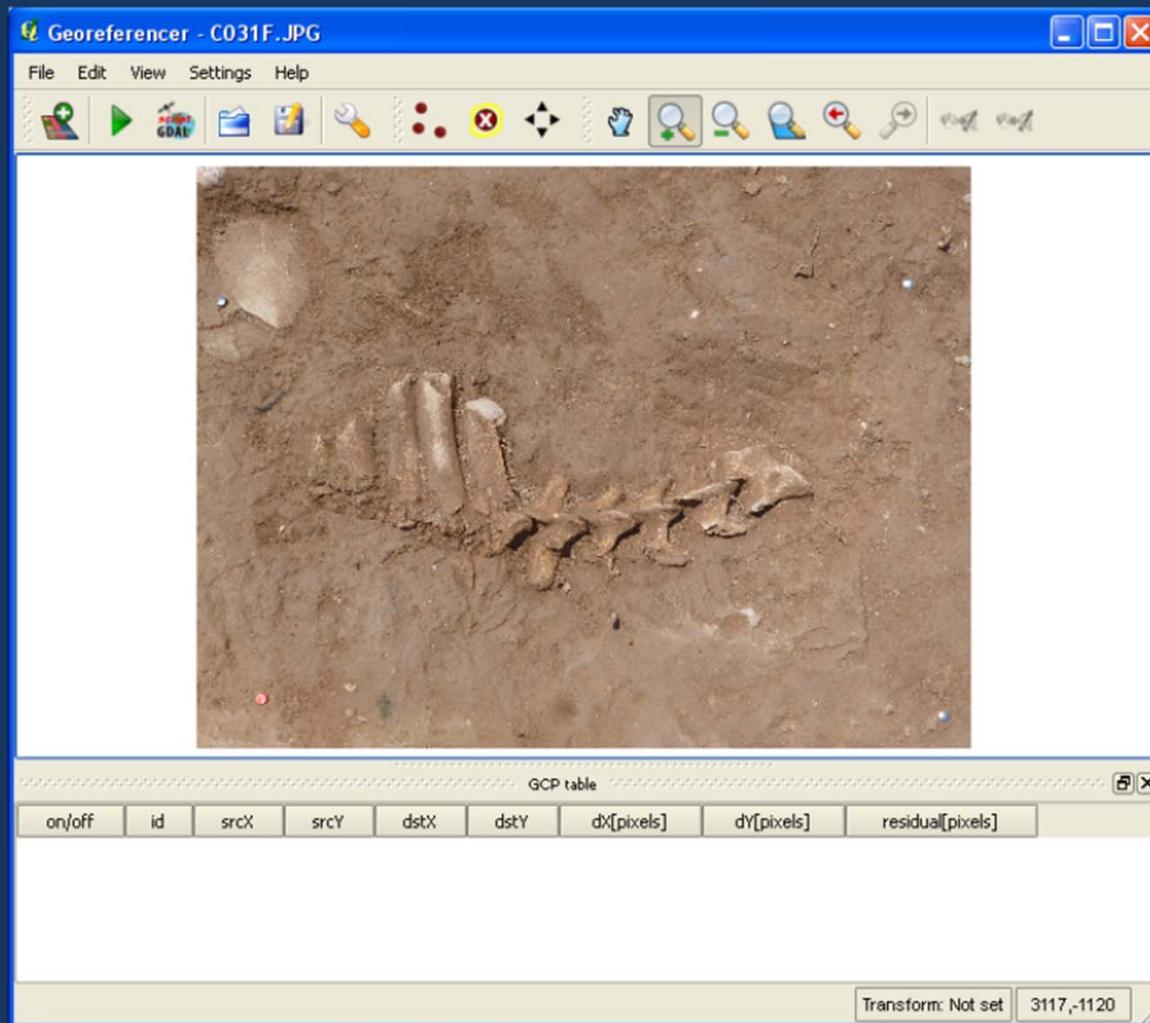

### 3.3 Vertical Sections

The position of all sections are processed and transformed into lines with specific properties including the relative path of the final image of each section

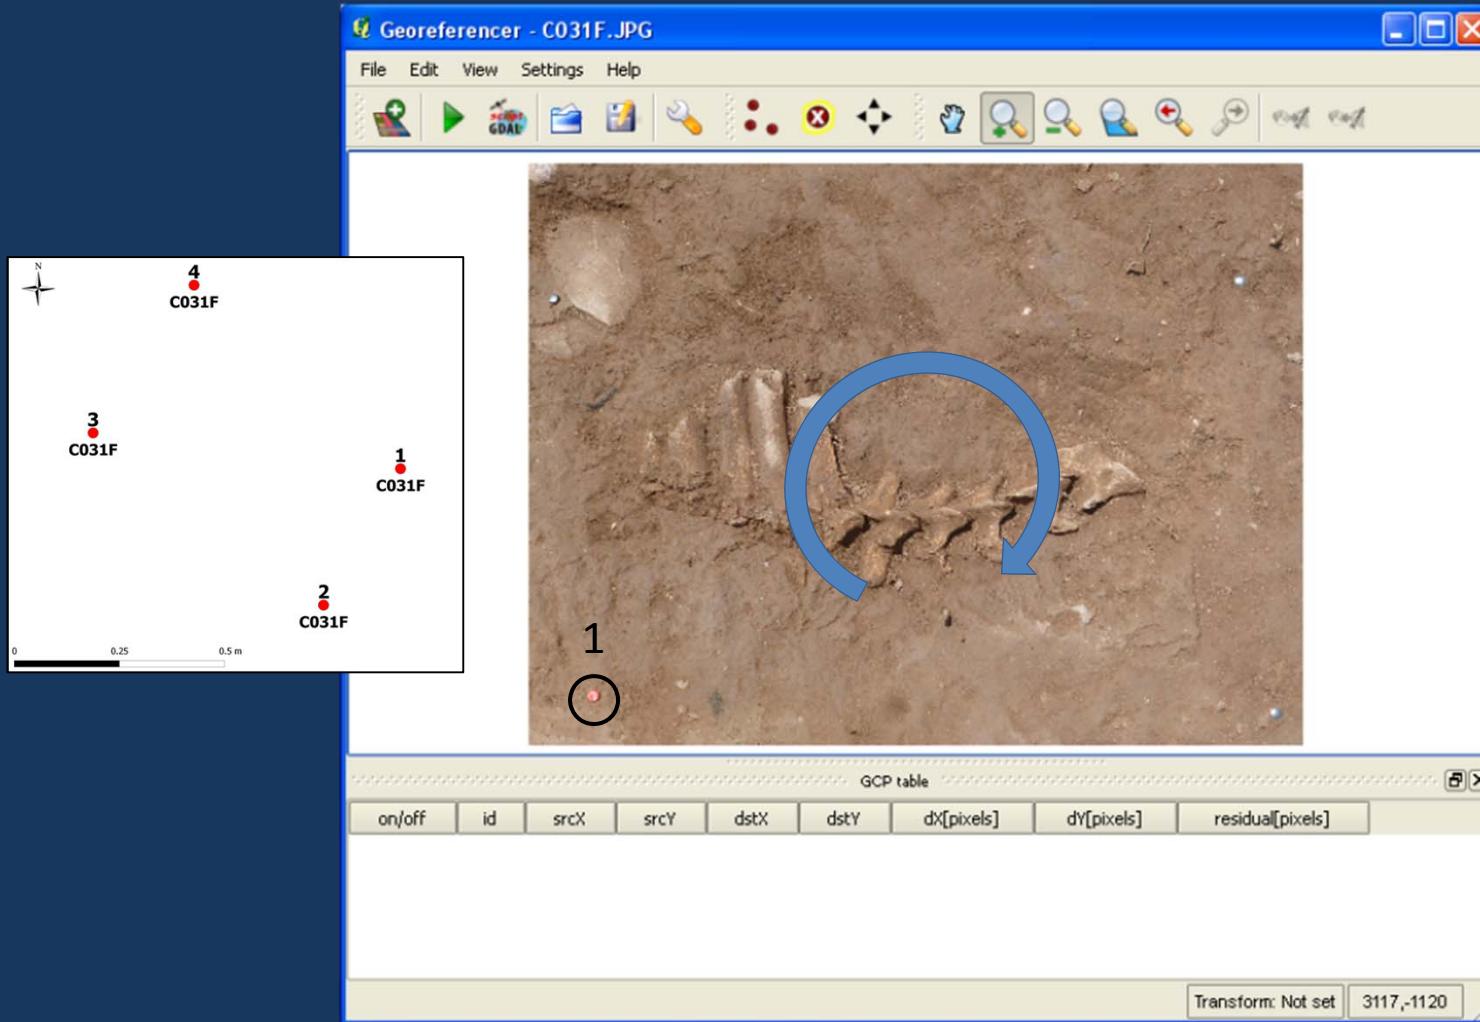

## 3.4 Ortho-rectified Photographs

Photographs are loaded for georeferenciaciation

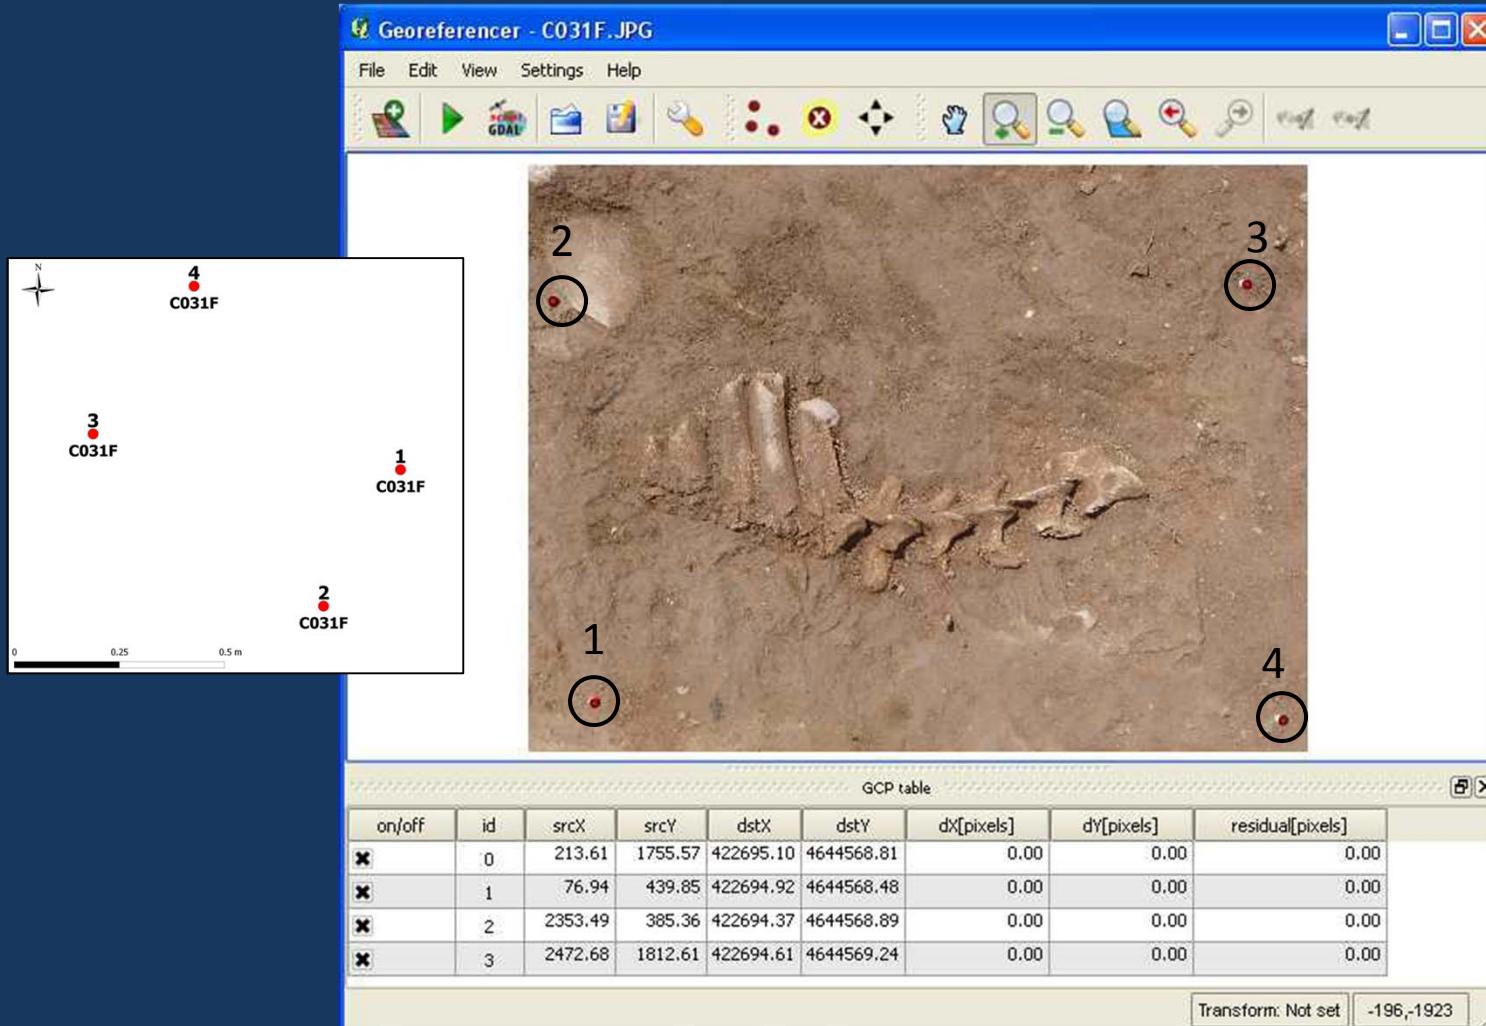

## 3.4 Ortho-rectified Photographs

Points are easily located thanks to acquisition

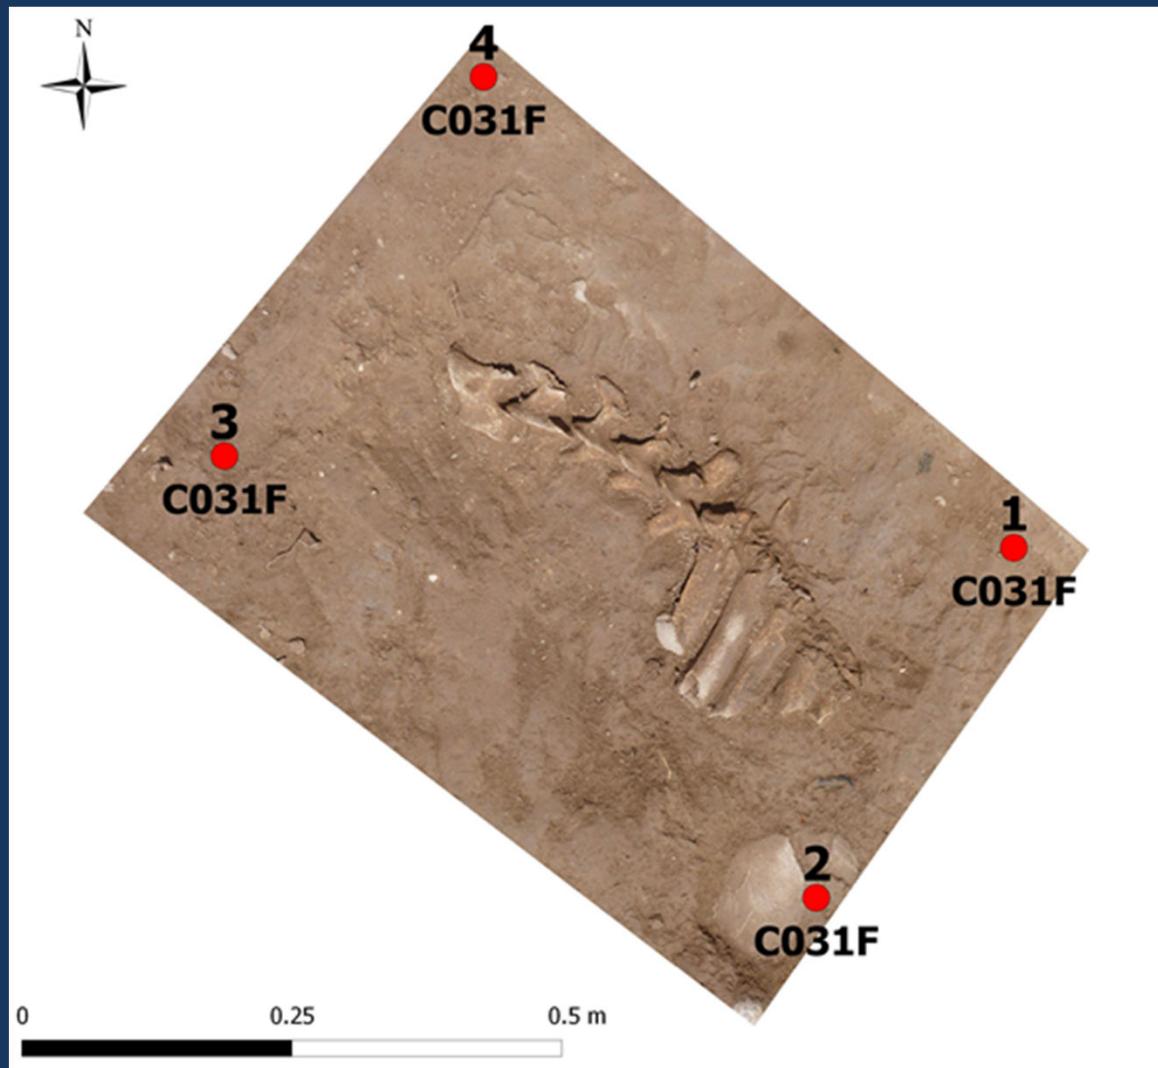

## 3.4 Ortho-rectified Photographs

Points are easily located thanks to acquisition

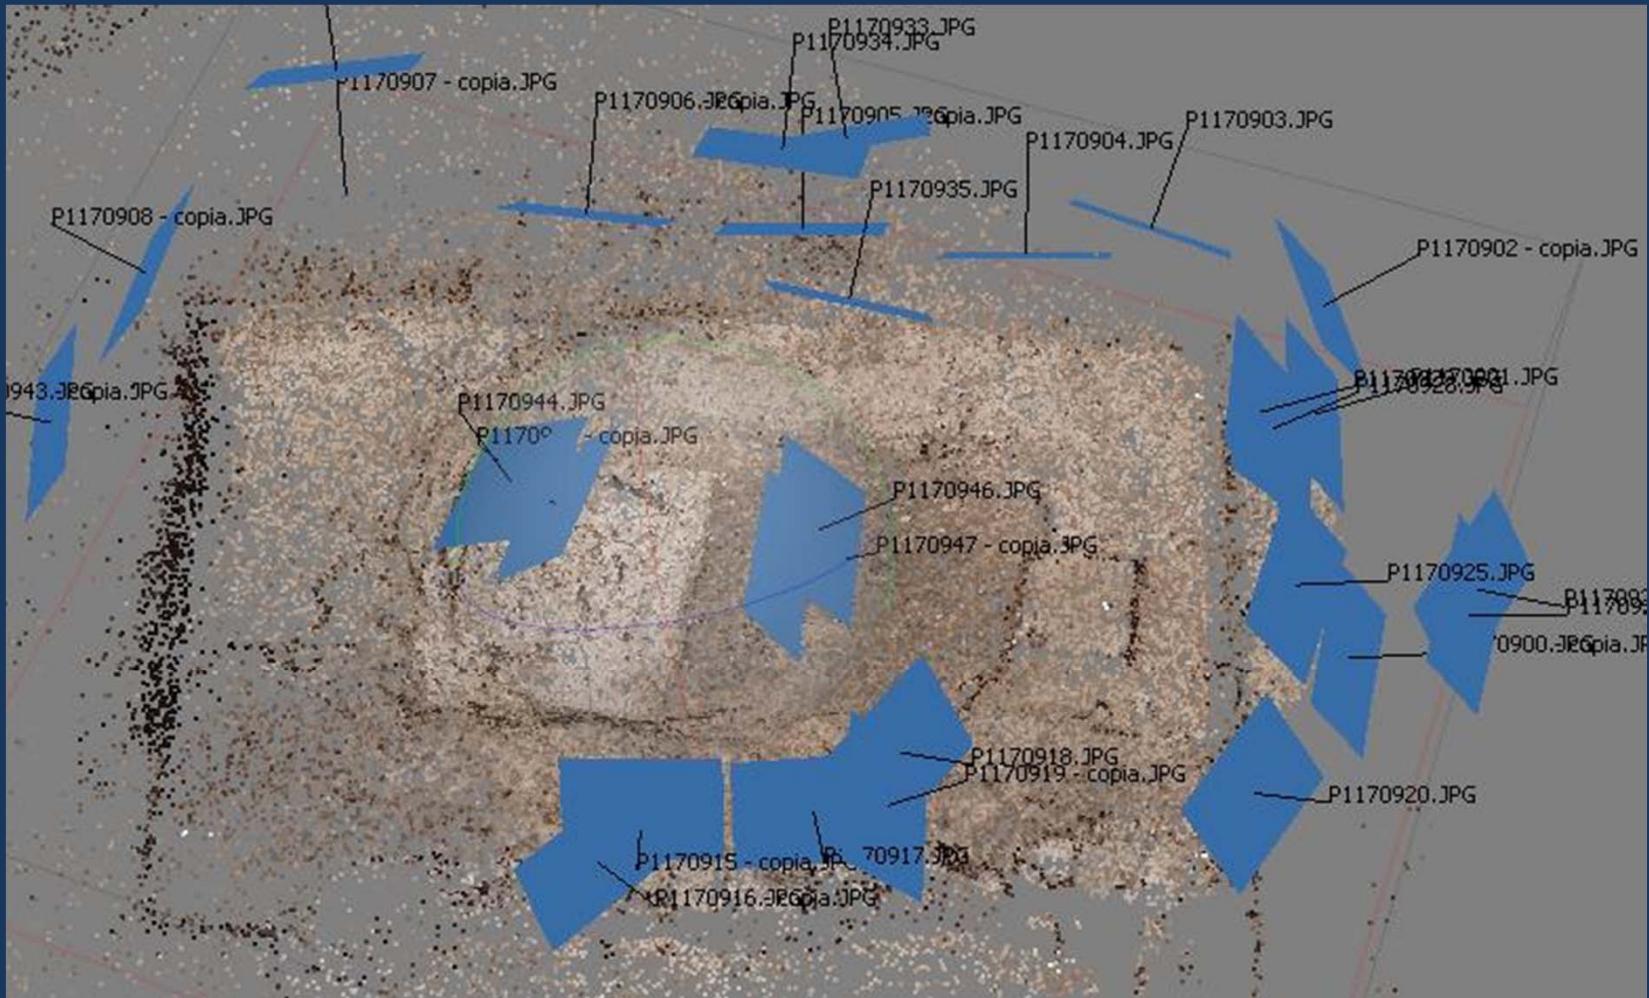

## 3.4 Ortho-rectified Photographs

The georeferenced photograph can be used for interpretation and drawing

## 3.5 Photogrammetry

First, a selection on the photographs is processed to obtain a 3D scatter pointset

## 3.5 Photogrammetry

The scatter is then transformed into a mesh and the texture transferred

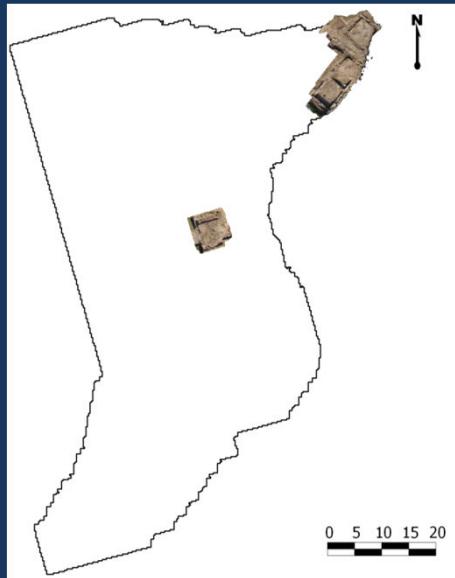

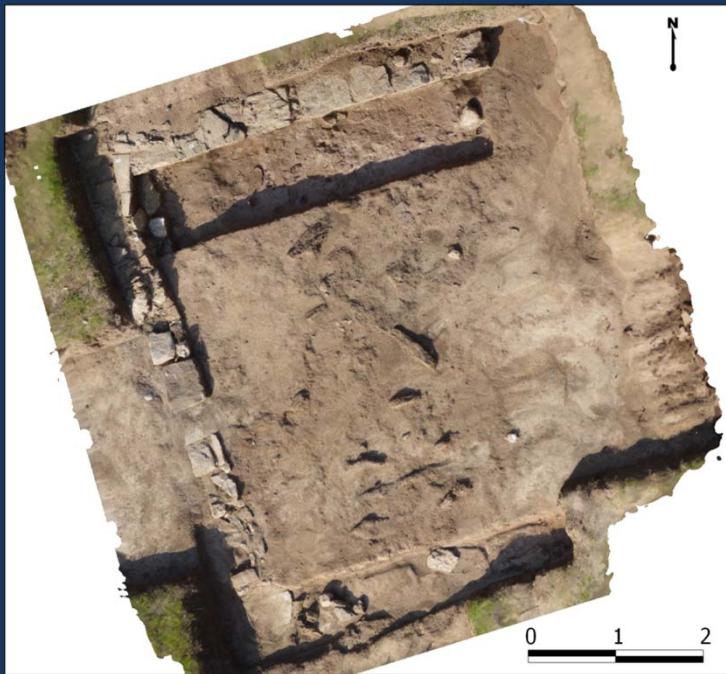

## 3.5 Photogrammetry

The topographic points associated to the photogrammetry are used to georeferenciate the model

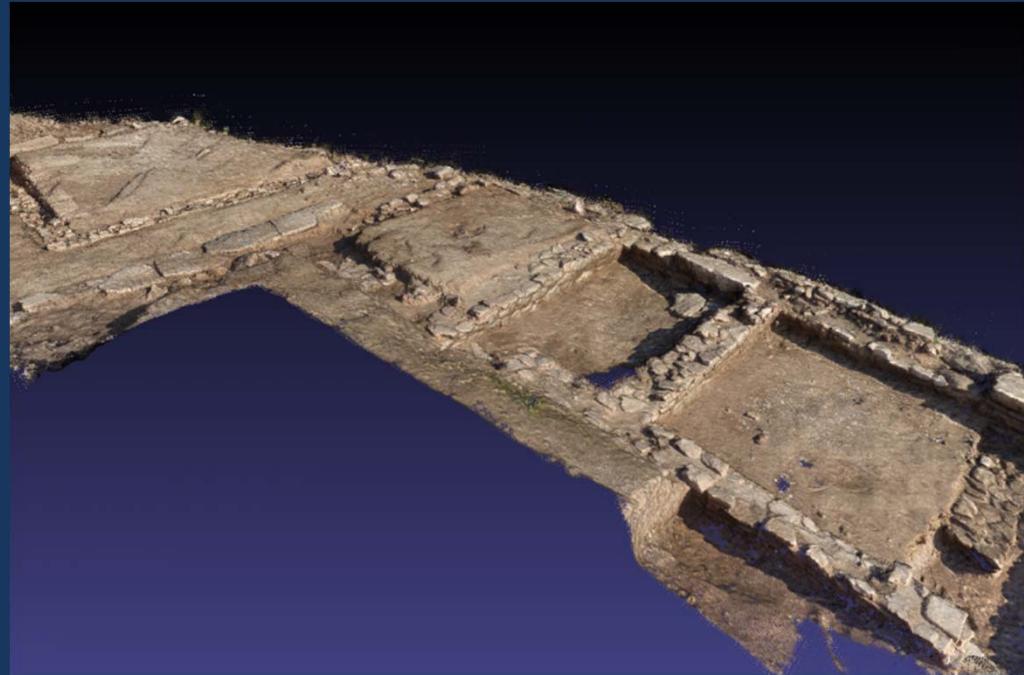

## 3.5 Photogrammetry

Final models can be used in 2D for drawing

## 3.5 Photogrammetry

Or in 3D for element extraction and virtual applications

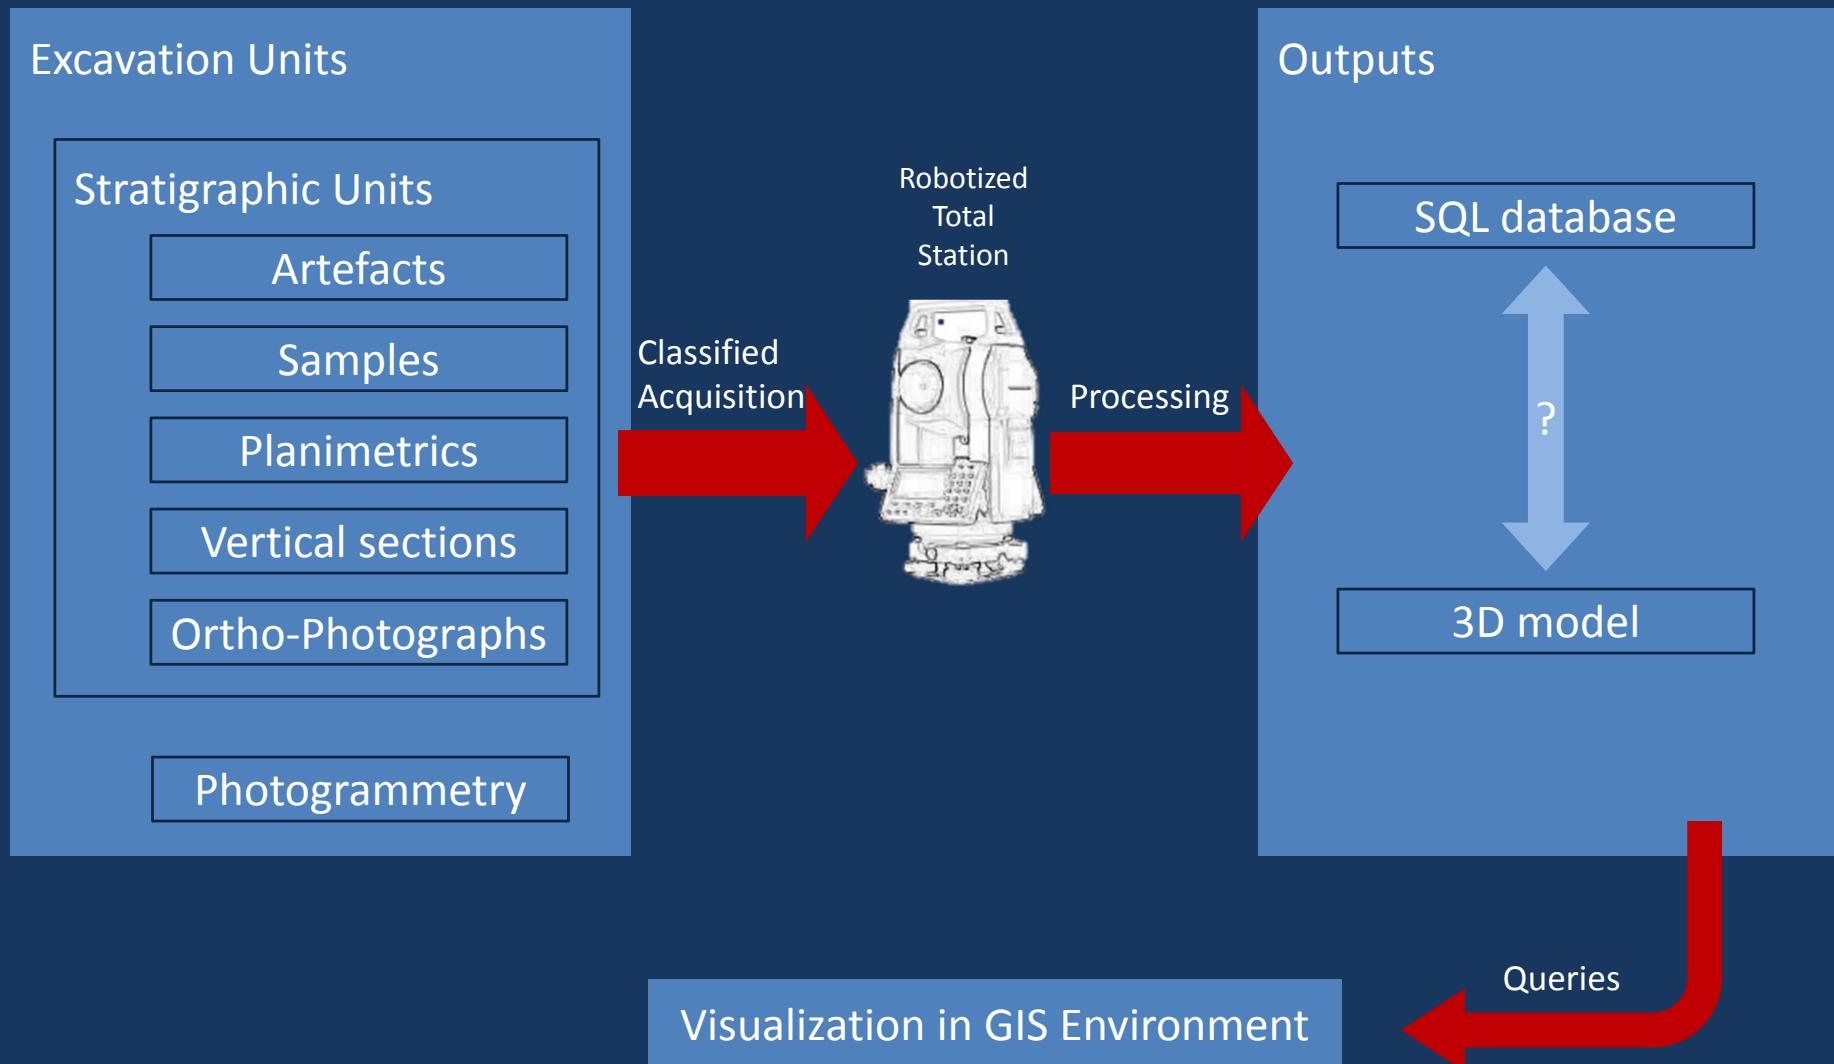

**PART 1**  
**Introduction**  
**The Choice of a Methodology**

**PART 2**  
**Acquisition**  
**Pre-processed data**

**PART 3**  
**Processing**  
**Digital outputs with a “manual definition”**

**PART 4**  
**Summary**  
**“Work in Progress”**

## 4.1 Diagram of the Chosen Workflow

## 4.2 Main Methodological Choices

The main concerns are the continuous mapping of the excavated elements and the optimization of the available resources in terms of time of processing

Pre-processed acquisition

Processing

Outputs

A Protocol  
differentiating  
categories of objects  
to map

An Association of  
objects to map with  
single ortho-  
photographs

Field Metadata

Drawings based on  
ortho-photographs

A mixed 2D/3D  
methodology

A combined 3D  
approach

A Spatial database

A 3D model

## 4.3 Problems and Open Questions

### First year of implementation

*The processing is still in progress and will require modifications of the protocol*

### Training

*The work team should be trained to the use of the main tools and the processing steps*

### Homogenization

*The data acquired before the implementation of the protocol should be integrated and updated*

### An intermediate position

*Steps of the manual approach as vertical sections are maintained and present difficulties during processing*

### A real 3D approach?

*The interpretation is still based on 2D maps, the links between the interpretation platform and the 3D model need to be implemented*

# Thank you for your attention
